COMMENT

```
cDNA was primed with a Noti-oilgo(dT) primer. Five prime and enriched, double-stranded cDNA was digested with Not I and cloned into the Not I and Eco RV sites of the pcMySPORT 6 vector. Library was constructed by Life Technologies. Contact : Feng Liang Life Technologies, a division of Invitrogen 9800 Medical Center Drive Rockville (Maryland 2080, USA Fax : (1) 301 610 8371 Email : fliangelifetch.com URL : http://fulllength.livviltogen.com"

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                              2101

mutations cs, forensics, gene mapping, identification of mutation le for genetic disorders or other traits and to assess Claim 1; SEQ ID No 5090; 103pp; English diagnostics, 

The invention relates to isolated polynucleotide (I) and polymerase chain reaction (FCR) primers, oligomets, and for chromosome conditions are chain reaction (FCR) primers, oligomets, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain reaction (FCR) primers as expressed sequence tags of identifying expressed genes. (I) is useful in gene therapy techniques of or identifying expressed genes. (I) is useful in gene therapy techniques of or seture normal activity of (II) or to treat disease states involving or a food supplement. (II) and its binding partners are useful in medical cannot state a series and as a food supplement. (II) and its binding partners are useful in medical cannot state as expressing (II). (I) and (II) are useful in medical cannot state and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications in casponsible for genetic disorders or other traits to assess biodisersity and to produce other types of data and products dependent on DNA and and amino acid sequences. AASA117-AASA544 represent novel human condition, the sequence data for this patent did not appear in the printed sequence data for this patent did not appear in the printed of sequence data for this patent did not appear in the printed of a produce of the invention.

complementary with the target gene and has at least one end a single-stranded segment of 1-4 nt. The method provides or oligoribonucleotides for antisense inhibition of gene expression usef e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps
                                                                                                                                                                                                                cytokine, Id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases stability and thus intracellular concentration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 TATATCACAGAIGTGCCAAATGGGTTTCATGTTAACTTGGAAAAAATGCCGACGGAAGGA

des a novel receptor tyrosine kinase, at is expressed on human endothelial acular endothelial growth factor and it is implicated in clinical.

S isolated from a human umbilical vein contained from a human umbilical vein solated from a human endothelial vein littors where also Aav99850-53). The predicted differences from the previously from the previously from the previously from the previously from to Lys, 848 (Glu to Val) and 1347 tein predicted by computer modeling to tionality. The invention also relates combinant hosts which contain a DNA a DNA fragment encoding the without a membrane anchor second human KDR, and human mutant ofeins or fragments can be used in send agonists of human KDR (claimed).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  33.44
Antagonists of XDP useful for treating diseases involving necanglogenesis e.g. diabetic retinal vascularization, cancers (e.g. brain, breast, etc.) and forms of inflammation e.g. rheumatrid arthritis, psoriasis, contact dermatitis and hypersensitivity reactions. The polynucleotides are useful to screen for KDR
                                                                                                                                                                                                                                                        Saps

                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for inhibiting expression of a target gene (ABL91658-ABL91797) in a cell by introducing at least one oligoribonuclectide that has a double-stranded structure consisting of a most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least one end a single-stranded segment of 1-4 nt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against
                                                                                                                                                                                                                                                Inhibiting gene expression in cells, useful for e.g. treating tumors, by introducing double-stranded complementary oligoRNA having unpaired terminal bases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cytokine, Id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oligonuclectides, probably because the unpaired overhang increases stability and thus intracellular concentration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 4044 BP; 1163 A; 885 C; 1021 G; 975 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Dp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for inhibiting expression of a target gene (AB19165-AB19179) in a cell by introducing at least one oligoribonucleotide that has a double-stranded structure consisting of at most 49 sequential nucleotide pairs, with at least part of one strand single-stranded sequent of 1-4 nt. The method provides single-stranded sequent of 1-4 nt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known
                                                                                                                                                                                                                                                                                                                                                                                            Human; HIV; HCV; gene expression; oligoribonucleotide; tumour; pathogen; Plasmodium; virus; viroid; cytokine; prion; antisense oligonucleotide; cytostatic; virucide; protozoacide; antibacterial; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3443 GTCAGAGACCCACGITITCAGAGITGGTGGAACAITIGGGAAAICTCTTGCAAGCTAATG 3502
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting gene expression in cells, useful for e.g. treating tumors, by introducing double-stranded complementary oligoRNA having unpaired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            278 CAGGGGAAGAAAICCICCAGAAGAAAAITACAAICAGAGAICAGGAAGCACCAIACC 337
